

SehatRx

Turns a doctor's voice into a ready prescription — instantly.

An AI prescription app, built for real Indian clinics

SehatRx

Consultations to prescriptions, without the paperwork.

SehatRx listens to your consultation, drafts the prescription, and puts it in front of your patient the moment you approve it.

-  Record consultations and get instant AI transcripts
-  Review AI-drafted prescriptions before you approve them
-  Send prescriptions straight to your patient's portal

The Problem

Paperwork is eating doctors' time

Handwritten and hard to read

Every prescription is written by hand, fast, and often only the pharmacist can read it.

Prescriptions get lost

Paper slips go missing, get torn, or end up as a blurry photo on someone's phone.

Many patients are left out

A lot of elderly patients can't read English well, and plenty don't even have an email address.

40–60

patients seen by
one doctor, every day

How It Works

Just talk. The app does the rest.

Why This Isn't Just Another AI Demo

Three things that actually matter to the people using it

The doctor just talks

No typing mid-consultation. For someone seeing 40+ patients a day, that's real time back.

Speaks the way people here do

Hindi, English, or a natural mix of both — not just the English half of the sentence.

Nothing gets lost

Live on the patient's phone the second it's sent, and a family member can see it too.

A Real Bug That Changed the Design

Found by actually using the app, not a hypothetical

01

The problem

A patient's own prescription was missing from their account after the doctor sent it.

02

What I found

The same patient existed as two separate records: one made by the doctor, one from sign-up.

03

The real fix

Removed the old verification-code system. Now the app matches by phone or email first, so one person is always one record.

AI Where It Helps. Not Where It's Risky.

For health and safety checks, a tested checklist beats an AI guess

Used AI for

- ✓ Turning speech into text
- ✓ Writing the structured prescription
- ✓ Translating it into Hindi

Did NOT use AI for

- ✗ Checking drug-allergy conflicts
- ✗ Checking dangerous drug combinations

A small, fixed checklist instead — instant, free, and it never makes something up.

Made for Indian Clinics, Not a Template

Every design choice traces back to a real patient, not a feature checklist

Hindi & English

Every prescription is available in both languages, automatically.

Read out loud

Patients who can't read still get the full instructions, spoken.

Family access

A caregiver can be linked in to see a relative's prescriptions too.

No email needed

A phone number alone is enough to sign up and stay in touch.

Built With

A simple, proven stack — not novelty for its own sake

React

FastAPI

PostgreSQL

OpenAI Whisper + GPT-4o-mini

JWT Auth

Vercel

AWS EC2

PDF + Audio Output

Live, Tested, and Actually Used

Every bug on this deck was found by using the real app

41

automated tests
passing

Live

on the internet
right now

2

real bugs found
and fixed after launch

See It for Yourself

No sign-up needed — demo accounts are ready to go
